WorldPay Integration

1. SUMMARY

This document provides a technical overview and implementation details for each Worldpay service integrated within the SFCC platform. The Worldpay cartridges (int_worldpay, int_worldpay_sfra, int_worldpay_csc, and int_worldpay_core) extends the functionality of reference eCommerce Storefront, enabling synchronous and asynchronous access to Worldpay payment transaction services listed below.

- Payment Methods:
 - 1) Sofort
 - 2) iDeal
 - 3) Qiwi
 - 4) Alipay
 - 5) Mistercash
 - 6) Yandex
 - 7) Boleto
 - 8) Paypal
 - 9) China Union Pay
 - 10) Enets
 - 11) Giropay
 - 12) Poli
 - 13) Poli NZ
 - 14) Konbini
 - 15) Przelewy24
 - 16) CashU
 - 17) Sepa DD
 - 18) 3D/Non 3D Credit Cards (XML Direct with client side encryption and tokenization features)
 - 19) 3D/Non 3D Credit Cards (XML Redirect with tokenization and hosted payment pages light box/iframe feature)

Added as a part of SFRA:

 - 20) WeChat Pay
 - 21) MOTO
 - 22) Google Pay
 - 23) Apple Pay
 - 24) Klarna (Pay Now / Pay Later)
 - 25) ACH Pay
 - 26) Alipay Mobile
- Order Notification Job
- Order Enquiry Job
- Order Cancel Or Refund Job for mac Issue identified orders
- Order CleanUp Batch Job
- DeleteCard Job (Deleting cards that are saved with void tokens)
- APM Look Up Service
- Multiple Merchant ID support
- Statement Narrative support
- Brazil Integration

18.2.0	Jul 16, 2018	<ul style="list-style-type: none">• Complete SFRA implementation

2. Change Log

3. COMPONENT OVERVIEW

3.1 Functional Overview

3.1.1 Payment Methods

All the supported Payment Methods are broadly categorized into XML DIRECT and XML REDIRECT Model based upon the manner in which they are integrated.

1.1.1.1 XML Direct Request

Merchants who collect and store their shoppers' payment details on their platform can use the XML Direct model as an effective payment-processing gateway. With this model, the merchant collects both order and payment details and then communicates the relevant payment details on a per order basis with Worldpay, for processing. The XML Direct model only allows for using a select number of online payment methods, where no consumer interaction is involved. Given the cost involved in establishing appropriate security measures, this model only applies for merchants with established high transaction volumes. Find below that list of supported Payment Methods that are XML DIRECT based.

- 1) Sofort
- 2) iDEAL
- 3) Qiwi
- 4) Alipay
- 5) Mistercash
- 6) Yandex
- 7) Boleto
- 8) Paypal
- 9) GiroPay
- 10) Poli
- 11) Poli NZ
- 12) Konbini
- 13) Przelewy24
- 14) CashU
- 15) SEPA DD
- 16) Credit Card- Direct (3D/Non 3D)
- 17) Klarna

Added as a part of SFRA:

- 18) WeChat Pay
- 19) MOTO
- 20) Google Pay
- 21) Apple Pay

1.1.1.2 XML Redirect Request

Merchants can also redirect the users to Worldpay Hosted page to collect payment details. It allows for real-time processing of payments and ensures a maximum number of up-to-date payment methods. The Hosted Payment Page service is secure, provides Worldpay with the required information to perform an active fraud risk assessment and, is the fastest way to get up and running with online payments. Find below the list of supported Payment Methods that are XML REDIRECT based

- 1) China Union Pay
- 2) Enets
- 3) Credit Card – Redirect (3D/Non 3D)
- 4) Klarna-Hosted Payment Pages

**** Refer to the Brazil Integration section for more details on Latin American Credit Cards and BOLETO.**

3.1.2 Capture Service

Capturing a payment can be done with tracking ID and without tracking ID for partial payment and full payment. A tracking ID is the shipment ID identifier that merchant should use to track the delivery of your order.

Capture Service with Tracking ID Request

```
<?xml version="1.0" encoding="UTF-8"?>
<paymentService merchantCode="YOUR_MERCHANT_CODE"
  version="1.4"> <modify>
  <orderModification orderCode="jsxml0000000000">
    <capture>
      <amount value="10000" currencyCode="GBP" exponent="2"
debitCreditIndicator="credit" />
      <shipping>
        <shippingInfo trackingId="AAA0000000" />
        <shippingInfo trackingId="BBB0000000" />
        <shippingInfo trackingId="XXX0000000" />
      </shipping>
    </capture>
  </orderModification>
</modify>
</paymentService>
```

Capture Service with Tracking ID Response

```
<?xml version="1.0" encoding="UTF-8"?>
<paymentService version="1.4"
  merchantCode="SAPIENTNITROECOM"> <reply>
  <ok>
    <captureReceived orderCode="T00028020000">
      <amount value="10000" currencyCode="GBP" exponent="2"
debitCreditIndicator="credit" />
    </captureReceived>
  </ok>
</reply>
</paymentService>
```

Capture Service without Tracking ID Request

```

<?xml version="1.0" encoding="UTF-8"?>
<paymentService merchantCode="YOUR_MERCHANT_CODE"
  version="1.4"> <modify>
  <orderModification orderCode="jsxml0000000000">
    <capture>
      <amount value="10000" currencyCode="GBP" exponent="2"
debitCreditIndicator="credit" />
      <shipping>
        <shippingInfo trackingId="" />
      </shipping>
    </capture>
  </orderModification>
</modify>
</paymentService>

```

Capture Service without Tracking ID Response

```

<?xml version="1.0" encoding="UTF-8"?>
<paymentService version="1.4"
  merchantCode="SAPIENTNITROECOM"> <reply>
  <ok>
    <captureReceived orderCode="T00028020000">
      <amount value="10000" currencyCode="GBP" exponent="2"
debitCreditIndicator="credit" />
    </captureReceived>
  </ok>
</reply>
</paymentService>

```

3.2 LIMITATIONS, CONSTRAINTS

This section details the limitations, constraints, and the best practice for merchants planning to integrate the Worldpay cartridge with SFCC Storefront.

- 1) At this moment, it is not possible to detect against session timeouts while the customer is entering payment details in the Worldpay forms. If there is a delay longer than the session timeout, basket contents are lost and order is placed and kept in Created state.
- 2) As the placement of the street number in addresses varies between different countries, the integration does not provide a parsing mechanism for the street number part as this would be very application-specific. To avoid future errors, the parsing of street numbers must be taken care of during the integration installation. If this step is ignored, the customer will have to supply the street number at the Worldpay payment page.

- 3) The cartridge supports both LookUp service and Multiple MID support service. However, only one of them should be enabled at a time.
- 4) At the moment, the cartridge supports only one generic message that is displayed on the Billing Page in case of a Failure response from APM's or Credit Card redirect method. This is mainly because we do not have any identifier or error code that is returned.
- 5) The web service Timeout that has been set in service profile is common across all the web service calls that we make to Worldpay be it Look up call, APM Order XML call, Authorization call etc.
- 6) Thank You page is displayed for both Successful and Pending Open Scenario; Merchant shall take care to display a message to the user on the Thank You page with a suitable disclaimer that demarcates both the scenarios.
- 7) SFCC has a default behavior to show an error message on Place Order page in case of a previously failed transaction. This can be removed by commenting/removing the code from summary.isml.

```
<div class="error-  
form">${Resource.msg(pdikt.PlaceOrderError.code,'checkout',null)}</div  
>
```

- 8) The Maximum and Minimum supported amount per APM should be configured at the SFCC level in the Payment Method configuration section
- 9) Merchants shall ensure that Overnight Shipping and One Day shipping methods should not be displayed for Delayed APMs or for the ones that have KIOS payments
- 10) Merchant Shall take care of implementing the validations on the additional field that will be supported at the Merchant's site (Example: CPF filed in-case of Boleto, Swift Code/Bank Code in-case of GiroPay), while implementing Credit Card Direct the merchant should ensure that the Credit Card Form is reset in case of any error.
- 11) Cartridge shall be responsible to update the order status and export status only on receipt of following notifications/enquiry AUTHORISED, CAPTURED. Rest all other notification/enquiry status are read by the Job and Transaction history flag is updated with the notification/enquiry status value no further action is taken by the cartridge
- 12) Merchants shall take care of implementing credit card fields refresh functionality in case of user changes the card Type after filling the card information for previous selection to have better shopper experience
- 13) At the moment, it is not possible to run client side encryption for saved credit card where card number displayed as masked even client side encryption feature is turned on in merchant Worldpay account and enabled corresponding setting in Merchant site custom preference.
- 14) Merchant must ensure customer sequence number not exceeding 64 characters length and may contain alphanumeric or underscore.
- 15) Tokenization would be applicable for registered user only provided tokenization feature is turned on in merchant Worldpay account and enabled corresponding setting in Merchant site custom preference.
- 16) At this moment, it is not possible to validate mac secret identifier into response [failure /pending] URL's for all Redirect APMs and Redirect Credit Card orders.

- 17) Notification feature is restricted to only allow IP address provided by Worldpay, and corresponding setting to be configured in Merchant site custom preference.
- 18) Merchants shall take care of implementing Order Settlement and refunds.
- 19) Merchant shall take care of enable/disable site preference for user to provide CVV on billing page as security measure in tokenization service for saved cards. Also, need to enable CVV check service from Worldpay to work properly.
- 20) Merchant must ensure SFCC Service Framework configurations are setup and configured as per the contract with Worldpay on service availability.
- 21) Merchant shall take care for CVV field validation as enable/disable, CVV in BM configurations will only hide/show CVV field on billing page and no CVV validation is performed on Worldpay.
- 22) Jobs Templates can be modified as per merchant needs. These Jobs templates are prepared for reference.
- 23) The images are available in static folder for the cards. They can further be modified if required.
- 24) In case of iframe and lightbox for Airplus, Denkort and Laser card, Payment Method is displayed with message "Please contact worldpay"
- 25) Credit Card Payment method must be enabled because of some code restrictions based on the Code.
- 26) For Credit Redirect, credit card must be available in the system.
- 27) Gifts certificates are out of scopes.
- 28) There are two LINT issues in the code related to @ character.

4. IMPLEMENTATION GUIDE

4.1 SETUP

This section describes the controller structure and name of files in Worldpay cartridges.

CARTRIDGE STRUCTURE

Controllers:

Controllers are present in the "int_worldpay" cartridge.

CONTROLLER NAME	DESCRIPTION
Worldpay	Main controller that acts as the external interface.
WorldpayHelper	Helper controller that supports and performs additional tasks required to complete
CheckoutServices	Controller that supports and executes the Checkout process.
COPlaceOrder	Controller that supports and executes the Checkout process.

- package.json – initialize hook or service

Scripts:

int_worldpay_core

- common/CreateRequestHelper.js
- common/PaymentInstrumentUtils.js
- common/Utils.js
- common/WorldpayConstants.js
- common/worldPayHelper.js
- init/httpServiceInit.js
- jobs/InitiateCancelOrderJob.js

4.2 EXTERNAL INTERFACES

Current version of cartridge support integration with APM's [as per the list shared in above Sections], however below URL can be referred to know more about the other possible APM'

Supported by Worldpay.

<http://support.worldpay.com/support/kb/gg/alternativepayments/content/apmguide.htm>

4.2.1 CHINA UNION PAY

China Union Pay (also known as Union Pay or CUP) is a payment method where shoppers with Union Pay cards can make online e-commerce payments. Union Pay issue Union Pay cards in China.

Property	Description/Value
Payment Type	Debit / Credit Card payment
Countries	China
Accepted Currencies	AED, BND, BHD, CNY, GBP, EUR, USD, AUD, CAD, CHF, GEL, HKD, IDR, INR, JPY, KRW, KZT, LAK, MOP, MYR, OMR, NPR, NZD, PHP, PKR, RUB, SGD, THB, TRY, TWD, UAH, VND.

```

4.2.3 ALIPAY

Alipay is a popular payment method that shoppers based in China use to make payments online.

After logging into their Alipay account, shoppers use one of the options below to complete their payment:

- eWallet
- Debit card
- Credit Card
- Bank Transfer
- Payment URL

Property	Description/Value
Payment Type	eWallet
Countries	China
Acceptance Currencies	CNY, GBP, EUR, USD, AUD, CAD, HKD, SGD.
Mode	DIRECT

4.2.12 Konbini

Digital Garage offers a number of payment methods that shoppers in Japan use to shop online. These include:

- Offline cash payment at a convenience store (known as Konbini). The penetration of convenience stores is very high in Japan, so this offers shoppers a very convenient way of making payments.

- Offline electronic payment at an ATM or internet banking (known as *Pay-Easy*).
- Online electronic payment by internet banking.

Since most payment options are off-line, merchants should expect the system to create a payment with `SHOPPER_REDIRECTED` status where it can remain for a number of days whilst the shopper makes their payment.

If the shopper pays immediately, the payment is in `SHOPPER_REDIRECTED` status for a short period of time and then moves to `AUTHORISED`.

Property	Description Value
Payment Type	Post-Pay Voucher/Internet banking/ATM Payment
Countries	Japan
Acceptance Currencies	JPY
Supported Languages	JP

The following table provides more detail of the available payment options:

Options	Notes	Authorization
Digital Garage (Konbini)	<p>The shopper places their order. At the end of the shopper journey the shopper views a unique payment reference, along with instructions on how to complete the payment.</p> <p>The shopper makes a note of the unique payment reference and visits their local convenience store.</p> <p>At the convenience store the shopper inputs their unique payment reference and phone number into a kiosk. The terminal prints a payment slip which the shopper takes to the store till and pays in cash.</p> <p>A number of major convenience stores participate in the Konbini scheme, including 7Eleven, Lawson, FamilyMart, Circle K Sunkus and Seicomart. Not all stores are automatically available to all merchants (please speak to your Worldpay support contact for more information).</p>	Delayed
ATM Payment	<p>The shopper places their order. At the end of the shopper journey the shopper is shown a unique payment reference, along with instructions on how to complete the payment. The shopper can either:</p> <p>Pay at an ATM which is part of the Pay-Easy payment scheme</p> <p>Pay at an ATM of another institution</p>	Delayed
Internet Banking	<p>The shopper places their order. At the end of the shopper journey the shopper is shown a unique payment reference, along with instructions on how to complete the payment. The shopper can either:</p> <p>Pay at a bank which is part of the Pay-Easy payment scheme</p> <p>Pay at a bank of another institution</p> <p>The shopper then logs into their internet banking application to complete the payment.</p>	Delayed

4.2.13 Poli

POLi is real-time bank transfer payment method that shoppers can use to make real-time payments directly from their online bank account.

To make a payment by using this method:

- On the payment page, the shopper selects the Poli payment method. The shopper is redirected to the Poli website.
- The shopper selects the bank from which the payment must be made. The shopper is redirected to the website of the bank.
- The shopper logs on to the bank and makes the payment.

Payment method properties

The properties for this payment method are described in the following table.

Property	Description/Value

4.2.17 KLARNA

Klarna is a buy now, pay later payment method that provides a fast checkout process.

Note: *Billing country should match with the application locale.*

Business Manager Configurations.

Step 1: Navigate to Merchant Tools > Ordering > Payment Methods

Step 2: Verify that Payment Method **Klarna**, associated with id KLARNA-SSL is enabled

Payment Methods

Payment Methods

Payment methods are managed here. To create a new payment method, click the **New** button. To remove a payment method click the remove icon in the payment method row. The default payment methods can't be removed, and their IDs can't be changed. When you select the CREDIT_CARD payment method, credit/debit cards can be reordered through drag-and-drop.

Language: Default

ID	Name	Enabled	Sort Order
ELV-SSL	SEPA	Yes	29
ENETS-SSL	eNETS	Yes	12
GIFT_CERTIFICATE	Gift Certificate	Yes	5
GIROPAY-SSL	GiroPay	Yes	24
IDEAL-SSL	IDEAL	Yes	20
KLARNA-SSL	Klarna	Yes	22
KONBINI-SSL	Konbini	Yes	26
MISTERCASH-SSL	MisterCash	Yes	18
MOTO	Worldpay-MOTO	Yes	8
PAYPAL-EXPRESS	Pay Pal	Yes	10
PAYWITHGOOGLE-SSL	Google Pay	Yes	30

Step 3: The Configurations related to KLARNA can be found by navigating to,

Merchant Tools > Site Preferences > Custom Site Preference Groups > Worldpay payment service settings

Id : WorldPayKlarnaPaymentMethods

Name	Value	Default Value
Klarna Product Type Values (WorldPayKlarnaPaymentMethods)	<div> None KLARNA INSTALLMENT (KLARNA_SLICEIT-SSL) KLARNA PAYLATER (KLARNA_PAYLATER-SSL) KLARNA PAYNOW (KLARNA_PAYNOW-SSL) </div>	

Note : The cartridge is only supporting *Pay Now* and *Pay Later* product type values.

Shopper Experience:

The screenshot displays the WorldPay checkout interface. At the top, there are several payment method options: Nordea, Nordea, Gift Certificate, Pay Pal, China Union Pay, Klarna (which is underlined and highlighted with a blue bar), Wechatpay, CREDIT (in a yellow box), and Google Pay. Below these options, the text "Credit Card - Redirect" is visible. The form contains three input fields: "*Email" (empty), "*Phone Number" (containing "3333333333"), and "*Product Type Value" (a dropdown menu showing "KLARNA PAYLATER" with a downward arrow). At the bottom of the form, there is a blue button labeled "Next: Place Order".

For more details, refer the following URL:

<https://developer.worldpay.com/docs/wpg/apms/klarnakp>

4.2.18 YANDEX

Yandex.Money is primarily an eWallet that shoppers based in the countries in the [Payment Method Properties table](#) below use to make real-time online payments. There is an additional option available to shoppers wishing to pay by a credit or debit card linked to their Yandex.Money account.

Property	Description/Value
Payment Type	eWallet/credit and debit card
Countries	Armenia, Azerbaijan, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Russia, Tajikistan, Turkmenistan, Ukraine and Uzbekistan
Accepted Currencies	RUB and USD
Mode	DIRECT

4.2.19 MOTO

MOTO is the mobile or telephone order, where the customer service agent placing the order for customer. In order to use moto payment your customer service center agent should have the 'Login_on_behalf', 'Login_Agent permission'.

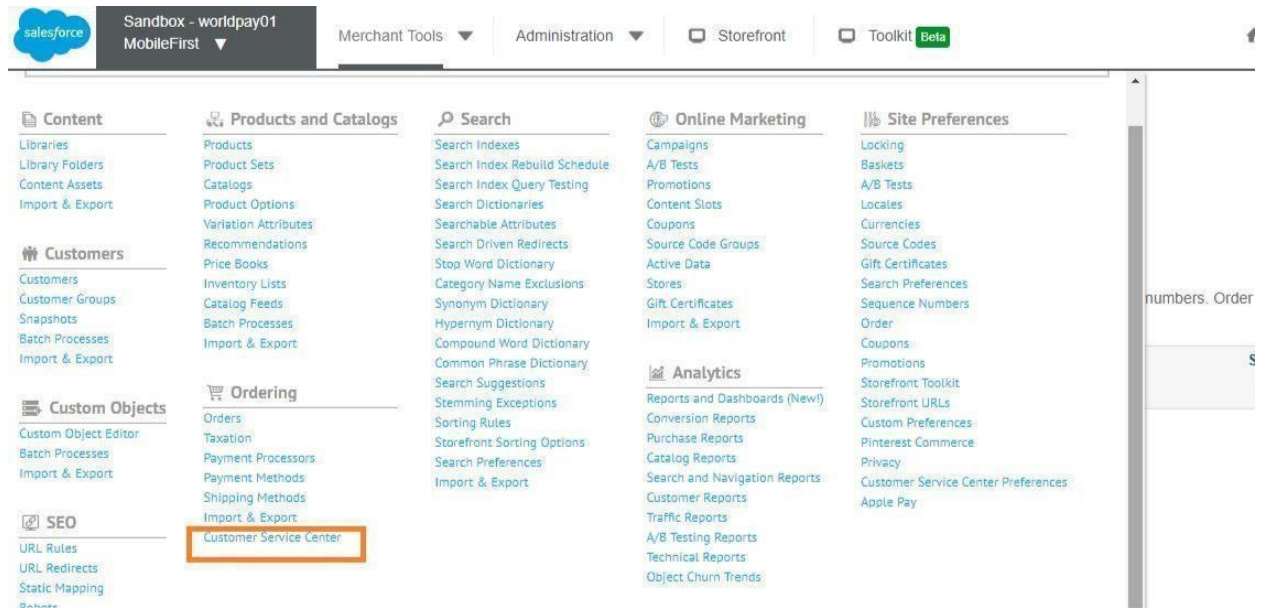

- i) Navigate to Administration > Organization > Roles and permission
- ii) Click the roles
- iii) Click functional permission
- iv) Select the site
- v) Give 'Login_on_behalf', 'Login_Agent permission.

Moto payment can be handled in two ways

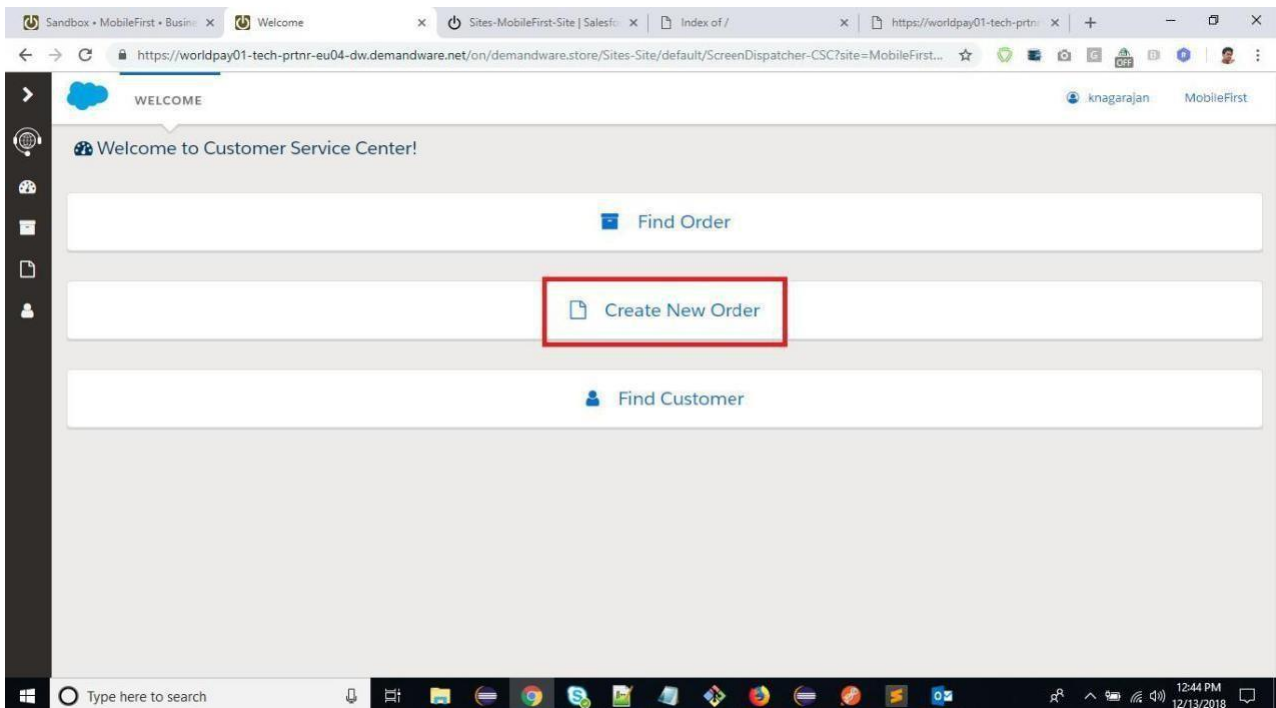

1). Customer service agent placing the order for the customer from business manager itself. In order to use this update the following settings in your business manager, just to disable the amount to be paid field in the credit card payment section.

- a) Navigate Administration > Site development > Customer service center settings
- b) Open Order payment Instrument in customizable area
- c) Update the existing condition "condition" : "data.payment_method_id===
'CREDIT_CARD'" Search for "condition" : "data.country !==
'FR'", After that add
"meta" { "disabled" :
 true
 }
}
- d) Since the customer service center customization works with OCAPI settings, make sure your site have the access to 'POST /orders/{order_no}/payment_instruments' in (Administration > Site Development > Open commerce settings).
- e) Please Refer the attached Workflow.

4.2.20 WECHATPAY

WeChat Pay is a eWallet payment method, incorporated into the WeChat app. It is one of the most popular payment methods in China; with over 600 million active users, WeChat Pay is available to shoppers who hold a Chinese domestic bank account. When adding a bank card

(Credit or debit) to their WeChat wallet, shoppers must also provide their Chinese ID (resident identity card), name and phone number. These details are verified in real-time with their bank and must match exactly for successful verification. Without successful verification, shoppers will not be able to use WeChat Pay for online purchases.

WeChat Pay is available in 10 currencies but shoppers will always have their wallet debited in CNY. WeChat Pay will perform any currency conversion immediately and show the CNY amount throughout the shopper journey. The exchange rate is obtained from their partner settlement banks (China Construction Bank or China CITIC Bank) at 10am each day (02:00 UTC), which is shown to the shopper on the payment success page.

Shoppers can link multiple bankcards to their wallet. They can opt to fund their payment from their wallet, provided they have a sufficient balance, or directly from their linked cards at time of payment.

4.2.21 Stored Credentials

A stored credential is Visa or MasterCard information (such as a card number) stored by a merchant or its agent, a Payment Facilitator (PF) or a Staged Digital Wallet Operator (SDWO) to process future transactions.

Where to include the stored Credentials element:

To indicate that you are storing payment details, include `<storedCredentials>` with the usage value of "FIRST" in your authorization request:

```
<storedCredentials usage="FIRST"/>
</paymentDetails>
```

Store the transaction Identifier from the response

In the response, you get a `<transactionIdentifier>` (a child of `<schemeResponse>`), as shown below. This must be stored and (where applicable) supplied with subsequent use of these card details.

Note: The `<transactionIdentifier>` may contain up to 56 characters, and may include spaces, even at the beginning or end. Preserve all of these characters.

```
<schemeResponse>
  <transactionIdentifier>1234567890</transactionIdentifier>
</schemeResponse>
```

Note: There are two ways to use stored credentials, depending on whether the cardholder or merchant initiates a transaction.

CARDHOLDER initiates:

If the cardholder initiates a transaction with their stored details, you must include `<storedCredentials>` with the usage value of "USED":

```
<storedCredentials usage="USED">
</storedCredentials>
</paymentDetails>
```

MERCHANT initiates:

If the merchant initiates a transaction with the stored details (such as with a recurring payment), you must include:

- 1) <storedCredentials> with:
 - a) the usage value of "USED", and
 - b) the appropriate merchantInitiatedReason
- 2) <schemeTransactionIdentifier>, which is the <transactionIdentifier> from either:

Note: The Merchant initiated reasons can be INSTALMENT, RECURRING, UNSCHEDULED

To change the type of reason we have to change it from the code base in the following files:

- a) The types are mentioned in the properties file, named worldpay.properties

```
1. worldpay.storedcred.mi.INS
   TALMENT= INSTALMENT
   worldpay.storedcred.mi.REC
   URRING= RECURRING
   worldpay.storedcred.mi.UNS
   CHEDULED =
   UNSCHEDULED
```

- b) To change its type we have to change in file named

LibCreateRequest.js Find this code:

- a.

```
if (orderObj.createdBy.equals(WorldpayConstants.CUSTOMERORDER)
    && session.isMerchantInitiated())
```
- b.

```
if (eslint-disable-line)
```

 - i.

```
storedCredentials = new XML("<storedCredentials usage='USED'
    merchantInitiatedReason='
    Resource.msg('worldpay.storedcred.mi.UNSCHEDULED', 'worldpay',
    null)");
    worldpay.storedCredentials.set("eslint-disable-line")
```

In this part of code change inside Resource.msg.

- *For e.g., for installment + Resource.msg('worldpay.storedcred.mi. INSTALMENT, 'worldpay', null) And so on,*

- a) The "FIRST" response message
- b) The previous "USED" response message

```
<storedCredentials usage="USED" merchantInitiatedReason="UNSCHEDULED">  
<schemeTransactionIdentifier>1234567890</schemeTransactionIdentifier> <!-- <transactionIdentifier> response from FIRST or USED  
request-->  
  
</storedCredentials>  
</paymentDetails>
```

REQUEST:

```
<?xml version="1.0" encoding="UTF-8"?>
<paymentService version="1.4"
  merchantCode="YOUR_MERCHANT_CODE"> <submit>
  <order orderCode="YOUR_ORDER_CODE">
    <description>YOUR DESCRIPTION</description>
    <amount currencyCode="GBP" exponent="2" value="5000" />
    <paymentDetails>
      <CARD-SSL>
        <cardNumber>4444333322221111</cardNumber>
        <expiryDate>
          <date month="01" year="2020" />
        </expiryDate>
        <cardHolderName>A Shopper</cardHolderName>
        <cardAddress>
          <address>
            <address1>47A</address1>
            <address2>Queensbridge Road</address2>
            <address3>Suburbia</address3>
            <postalCode>CB94BQ</postalCode>
            <city>Cambridge</city>
            <state>Cambridgeshire</state>
            <countryCode>GB</countryCode>
          </address>
        </cardAddress>
      </CARD-SSL>
      <storedCredentials usage="FIRST" />
      <!--Indicates that you are storing credentials-->
      <session shopperIPAddress="123.123.123.123" id="0215ui8ib1" />
    </paymentDetails>
    <shopper>
      <shopperEmailAddress>ashopper@myprovider.com</shopperEmailAddress>
      <browser>
        <acceptHeader>text/html</acceptHeader>
        <userAgentHeader>Mozilla/5.0 ...</userAgentHeader>
      </browser>
    </shopper>
  </order>
</submit>
</paymentService>
```

RESPONSE:

The response includes the <schemeResponse> parameter, within which you get the <transactionIdentifier>. Where required, use the value returned in <transactionIdentifier> as the <schemeTransactionIdentifier> in your request to use credentials:

```
<?xml version="1.0" encoding="UTF-8"?>

4.2.22 TOKENIZATION

Tokenization is the replacement of sensitive credit card data with a unique identifier (the token) that cannot be mathematically reversed.

- ☐ Choose [shopper](#) tokens if you **only** intend to use tokens for your eCommerce channel
- ☐ Choose [merchant](#) tokens if you intend to share tokens between your eCommerce and your Point of Sale (POS) channels (using Worldpay Total as your Omni-channel solution)

SHOPPER TOKEN:

Create a shopper token with a payment request.

<createToken> is the instruction to create a token for the card used. **<createToken>** must contain **<authenticatedShopperID>** - a reference that uniquely identifies each shopper so that you can associate their payment tokens with them.

Request :

```
<?xml version="1.0" encoding="UTF-8"?>
<paymentService version="1.4" merchantCode="MYMERCHANT">
  <submit>
    <order orderCode="T0211010">

MERCHANT TOKEN:

Create a merchant token with a payment request

<createToken> is the instruction to create a token for the card used. <createToken> must contain tokenScope="merchant" - an attribute of <createToken> which states that the token will be a merchant token.

The response to a Hosted order with a create token request is exactly the same as a standard Hosted response

Request:

```

<?xml version="1.0" encoding="UTF-8"?>

4.2.23 3DS2

3D Secure 2 allows businesses and their payment provider to send more data elements on each transaction to the cardholder's bank. Worldpay have a relationship with Cardinal Commerce whereby your website integrates to Cardinal Commerce's 3DS2 authentication service for Device Data Collection and challenge flows. Worldpay manages the rest of the process.

Device Data Collection

- Create a JSON Web Token (JWT) on your server that is passed to the browser. When the shopper has entered a card number, start the Device Data Collection (DDC).
- Include a hidden DDC iframe, with the DDC JWT and the shopper's card number, on your page.
- Post the form to Cardinal Commerce's DDC endpoint.
- You receive a notification (on the shopper's browser) that DDC is complete. DDC returns a JavaScript message event, containing a SessionId.

Initial Payment Request

- Use the SessionId and submit as dfReferenceId in your XML payment request.
- An authentication request is submitted to Cardinal Commerce to determine if a challenge is required. The possible outcomes are:
 - Frictionless Flow - An authorization is attempted (Proceed to Step 2 in Second Payment Request).
 - Challenge Required - Proceed to 3DS2 Challenge

3DS2 Challenge

- Extract the data from the challenge response.
- Create a challenge JWT on your server that is passed to the browser. Include a returnUrl and the specified values returned in the XML challenge response.
- Include a challenge iframe, with the challenge JWT and the optional merchant data (MD), on your page.
- Automatically submit this form to the Cardinal Commerce endpoint.
- The shopper completes the challenge in the iframe and is redirected to the returnUrl.

Second Payment Request

- Submit a second XML request, including the session id and machine cookie.
- If authentication is successful, Worldpay attempts authorization.

Initial XML Payment Request

Create the XML authorization request. Add the following two elements to your XML

- additional3DSData (Mandatory)
- riskData (Recommended to increase chances of a frictionless flow)

```
<?xml version="1.0" encoding="UTF-8"?>
<paymentService version="1.4" merchantCode="YOUR_MERCHANT_CODE"> <!--

</riskData>
    <!-- Additional 3DS data that you must provide to us -->
    <additional3DSData dfReferenceId="1f1154b7-620d-4654-801b-893b5bb22db1"
challengeWindowSize="390x400" challengePreference="challengeMandated" />
</order>
</submit>
</paymentService>

```

We pass the information to Cardinal Commerce, who matches the DDC to the payment request using the dfReferenceId value. This information is sent to the issuer who will then establish whether the payment requires additional authentication (i.e. a challenge) or not.

The response to your authorization request will be either a normal authorization response, which ends the payment flow, or a 3DS challenge response.

3DS Challenge

If the issuer decides that the payment requires additional authentication, they signal to Worldpay that a challenge is required. You will receive a response from us to redirect the shopper to a challenge page. The 3DS related information is inside the threeDSChallengeDetails element.

Example response with payload:

```
<?xml version="1.0" encoding="UTF-8"?>
<paymentService version="1.4"
  merchantCode="YOUR_MERCHANT_CODE"> <reply>
  <orderStatus orderCode="YOUR_ORDER_CODE">
    <challengeRequired>
      <threeDSChallengeDetails>
        <threeDSVersion>2.1.0</threeDSVersion>
        <transactionId3DS>rUT8fLKDviHXr8aUn3I1</transactionId3DS>
        <acsURL><![CDATA[www.worldpay.com]]></acsURL>
        <payload>P.25de9db33221a55eedc6ac352b927a8c3a08d747643c592dd8f8ab7d3...</payload>
      </threeDSChallengeDetails>
    </challengeRequired>
  </orderStatus>
</reply>
</paymentService>
```

Redirect to 3DS2 Challenge

As the redirect to challenge will be another Cardinal Commerce page, you must create a challenge JWT on your server that is passed to the browser.

Request Challenge Page

Create an iframe with an automatic form post to <https://secure-test.worldpay.com/shopper/3ds/challenge.html> (Test Environment), and to <https://secure.worldpay.com/shopper/3ds/challenge.html> (Production environment)

Second XML Payment Request

Use this request for the returnUrl to trigger the second XML Payment Request

```
<?xml version="1.0" encoding="UTF-8"?>
<paymentService version="1.4"
  merchantCode="YOUR_MERCHANT_CODE"> <submit>
  <order orderCode="YOUR_ORDER_CODE">
    <!--The order code from the first message-->
    <info3DSecure>
      <completedAuthentication />
    </info3DSecure>
    <session id="SESSION_ID" />
    <!--The session id in the first message-->
  </order>
</submit>
</paymentService>
```

Authorization Response

This is received because either the first authorization request was authenticated without a challenge (frictionless flow), or a challenge has been completed by the shopper.

The XML response from Worldpay confirms the result for the authorization.

```
<?xml version="1.0" encoding="UTF-8"?>
<paymentService version="1.4" merchantCode="YOUR_MERCHANT_CODE"> <!--
  -The merchantCode you supplied in the order-->
  <reply>
    <orderStatus orderCode="YOUR_ORDER_CODE">
      <!--The orderCode you supplied in the order-->
      <payment>
        <paymentMethod>VISA-SSL</paymentMethod>
        <amount value="5000" currencyCode="GBP" exponent="2" debitCreditIndicator="credit"
        /> <lastEvent>AUTHORISED</lastEvent>
        <AuthorisationId id="123" />
        <balance accountType="IN_PROCESS_AUTHORISED">
          <amount value="5000" currencyCode="GBP" exponent="2" debitCreditIndicator="credit"
          /> </balance>
        <cardNumber>4444**1111</cardNumber>
        <riskScore value="0" />
      </payment>
      <ThreeDSecureResult description="Cardholder authenticated" />
    </orderStatus>
  </reply>
</paymentService>
```

4.2.24 US DOMESTIC (Prime Routing)

PRIME ROUTING:

Prerequisites:

To use this service you must meet the following prerequisites:

-
- The service must be enabled on your account
- You must use the Direct XML API
- You must process transactions as sales

With the sales request, worldpay will automatically capture the funds from the shopper once the request has been authorized. For example, if you are a company that offers a digital product, be it a game or a video that is immediately downloaded once the customer has paid for it, you will want to know straight away that the customer has been charged for the item. There are two options for submitting Sale payments:

- You send a Sale API request
- Sale is set as the default on your US account

Sale request

The only difference between a sales and a standard Direct XML request is that you need to include the action attribute set to SALE within the <paymentDetails> element. Here is an example authorization request:

BM CONFIGURATION: *Go to the business manager > Merchant Tools > Site Preferences > Custom Preferences > Worldpay > Enable Sales request (yes)*

```
<?xml version="1.0" encoding="UTF-8"?>
<paymentService version="1.4"
  merchantCode="YOUR_MERCHANT_CODE"> <submit>
  <order orderCode="YOUR_ORDER_CODE">
    <description>YOUR DESCRIPTION</description>
    <amount value="2000" currencyCode="EUR" exponent="2"
  /> <orderContent><![CDATA[]]></orderContent>
    <paymentDetails action="SALE">
      <CARD-SSL>
        <cardNumber>4444333322221111</cardNumber>
        <expiryDate>
          <date month="01" year="2020" />
        </expiryDate>
        <cardHolderName>J. Shopper</cardHolderName>
        <cardAddress>
          <address>
            <address1>900 Chelmsford Street</address1>
            <postalCode>01851</postalCode>
            <city>Lowell</city>
            <state>MA</state>
            <countryCode>US</countryCode>
          </address>
        </cardAddress>
      </CARD-SSL>
      <session shopperIPAddress="123.123.123.123" id="0215ui8ib1" />
    </paymentDetails>
  </order>
  <shopper>
    <shopperEmailAddress>shopper email address</shopperEmailAddress>
    <browser>
      <acceptHeader>text/html</acceptHeader>
    </browser>
  </shopper>
</paymentService>
```

```

<userAgentHeader>Mozilla/5.0 ...</userAgentHeader>
</browser>
</shopper>
</order>
</submit>
</paymentService>

```

Sale response

The response is the same as a standard Direct XML response with a <lastEvent> of **AUTHORISED**. This will be followed shortly by a **‘CAPTURED’** notification (if enabled).

Note: In secure-test, the <lastEvent> is **‘CAPTURED’**.

Void

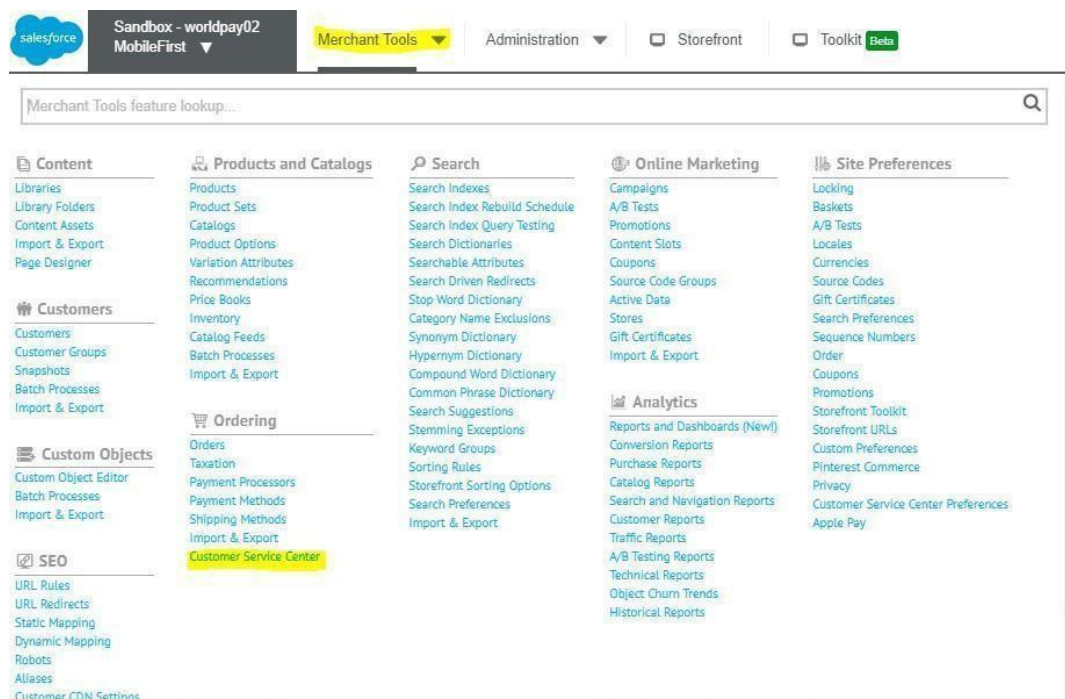

In some cases, you may wish to void a sale request. This is done with an order modification. This must be done within the same US business day as the sale request, else it will fail. If it does fail, you will need to submit a refund request.

How to void sale from the Business manager:

Note: The configuration and setup is explained in the installation guide for

SFRA.

Go to **Merchant Tools > Ordering > Customer Service Center**

Find the order to void:

WELCOME

Welcome to Customer Service Center!

Find Order

Create New Order

Find Customer

Click on the order. The next window will have the order details (Snippet inline). Click on more option to see void sale feature.

    /> </accountTx>
  </journal>
</orderStatusEvent>
</notify>
</paymentService>
```

Advanced Prime Routing

Advanced Prime Routing allows you to:

- Receive the debit network used to process the payment
- Specify your preferred debit networks
- Specify your routing preference

Routing preference

You can optionally provide a routing preference to specify how a particular transaction should be routed:

- `pinlessDebitOnly` - Route the transaction only through the PINless Debit networks
- `signatureOnly` - Route the transaction only through the signature networks
- `regular` - Use standard routing

Debit networks

The following table shows the debit network names used with preferred debit network and Receive debit network along with the supported transaction types.

Network	Recurring	eCommerce
Accel	✓	✓
AFFN	✓	✓
CU24	✓	✗
Jeanie	✓	✗
NYCE	✓	✓
Pulse	✓	✓
Shazam	✓	✓
Star SouthEast	✓	✓
Star West	✓	✓
Star NorthEast	✓	✓

Errors

All errors related to Prime Routing are reported under error code 10.

Error code	Description
10	Merchant is not enabled for prime routing
10	Invalid network Name: value supplied
10	Invalid routing Preference: value supplied
10	preferred Networks can have up to 12 networkName elements

ACH_DIRECT_DEBIT-SSL	ACH Pay	Yes	9
ALIPAY-SSL	Alipay	Yes	13
ALIPAYMOBILE-SSL	Alipay Mobile	Yes	34

For More Details Refer the following URL:

<https://developer.worldpay.com/docs/wpg/apms/alipay>

4.2.28 Stored Credential Disclaimer

Introduction:

Worldpay supports stored credentials for Credit Cards to comply with scheme mandates for storing (and subsequently using) card payment credentials for cardholder and merchant-initiated transactions.

How it works in SFRA?

For stored credentials, cartridge provides an option to show disclaimer message. To show disclaimer message, Merchant has to select show/hide disclaimer button and enter disclaimer message in Content-Asset. In addition to this merchant has options to choose

“Show disclaimer in store front” - On selecting “Yes” the disclaimer pop up link will be shown to the end user.
“Is Mandatory for store view” – On selecting “Yes” the end user has to agree with the disclaimer pop up message to place the order and to save the credit/debit card details.

Admin Configuration located at

Merchant Tools > Site Preferences > Custom Preferences > Worldpay

Is Disclaimer Mandatory?	No	Yes	Edit Across Sites
Show Disclaimer in the Frontend	Yes	Yes	Edit Across Sites

Content Asset:

Merchant Tools > Content > Content > saveCardDisclaimer

Presentation	
Rendering Template:	
Custom CSS File:	
Content	
Body:	Do You Want To Save The Card?
Year:	
Download Apply Reset	

Edit body to Change the message.

End User Interaction Flow:

Applicable only for Registered User.

☒ Save Card to Account

- **When “Is Disclaimer Mandatory?” is enabled**

1. End user should choose any of the options (Agree/Disagree) to proceed place order otherwise an error will throw like below.

The screenshot shows a credit card payment form. At the top, there is a card number field with a "CREDIT" icon. Below it are two dropdown menus for "Expiration Month" (set to "month") and "Expiration Year" (set to "year"). A "Security Code" field is also present. A checkbox labeled "Save Card to Account" is checked. Below the checkbox is a blue link labeled "Disclaimer". A yellow highlight is placed over the text "Please click on the disclaimer button to continue, and chose yes to save your card". At the bottom of the form is a large blue button labeled "Next: Place Order".

2. If end user choose, “YES” option then card details will save and order will be placed.

The screenshot shows a modal dialog box titled "Disclaimer" with a close button (X) in the top right corner. The dialog contains the question "Do You Want To Save The Card?" with two radio button options: "Yes" and "No". The "No" option is selected. A "Close" button is located at the bottom right of the dialog. In the background, the payment form is visible, showing the "Save Card to Account" checkbox checked and the "Disclaimer" link. A red text message at the bottom of the form reads "Please click on the disclaimer button to continue, and chose yes to save your card".

3. If end user choose “NO” option then card details will not be saved and save card checkbox become unchecked but order will placed.

- **When “Is disclaimer Mandatory” is disabled**

1. If end user clicks the disclaimer link and choose “Yes” option then card details will be saved and order Will be placed.
2. If end user choose “NO” option then card details will not be saved and save card checkbox becomes Unchecked and eventually order will placed.
3. If end user did not open disclaimer or did not choose any option then it will take it as “NO” and card details Will not be saved but order will placed.

Note: If user disagrees the card, details will not be saved even though stored credentials is enabled.

4.2.29 EXEMPTION ENGINE

Admin Configuration located at

Merchant Tools > Site Preferences > Custom Preferences > Worldpay

Name	Value	Default Value	
Enable Exemption Engine (WorldPayEnableExemptionEngine)	<input type="text" value="No"/>	No	Edit Across Sites
Exemption Type (WorldPayExemptionType)	<input type="text" value="Optimised Exemption (OP)"/>		Edit Across Sites
Exemption Placement (WorldPayEnableExemptionPlaceme...)	<input type="text" value="AUTHENTICATION (AUTHENTICATION)"/>		Edit Across Sites

For more details, refer the following URL:

<https://developer.worldpay.com/docs/wpg/scaexemptionsservices/exemptionengine>

4.2.30 Multi Merchant By Site

Enable merchants to configure unique worldpay merchant ID per site.

Example, if a merchant running 2 sites (US, UK) in one commerce cloud instance both site would use different merchant ID configurations. This means that orders placing in US would always be posted to one merchant ID and UK would go a different merchant ID.

Important Prerequisites

- When multi merchant support based on sites is required - all the worldpay merchant IDs should be created under same Admin. This step would be done by Worldpay at the time of on boarding. This would enable support for the saved card tokens support in case the merchant IDs are changed.
- To support the worldpay notifications we need to maintain the Storage scope of the CustomObject OrderNotifyUpdates to Site

Scope

- As of now, this feature is for ONLY new merchants not existing merchants who are already running multiple sites with one merchant ID.
- As the saved card tokens are not cross compatible across different merchant IDs - this would not work for existing merchants.

Admin Configuration located at
Merchant Tools > Site Preferences > Custom Preferences > Worldpay-MultiMerchant

1-2 of 2

Name	Value	Default Value	
Enable Merchant Support (enableMultiMerchantSupport) Global toggle for Multi Merchant Support	<div>Yes</div>		Edit Across Sites
Type of Multi Merchant (multiMerchantType)	<div>Based on Site (site)</div>	Based on Site	Edit Across Sites

- Site Preference to feature toggle
- Site Preference to select the type of multi-merchant
- Custom object (**MultiMerchantBySite**) to include all configuration that would vary.
- Need to update the following already existing site preferences per site,
 - WorldpayMerchantCode
 - WorldpayClientSideEncryptionPublicKey
 - WorldpayMerchantNumber
 - WorldpayInstallationId
- Make sure in the services configuration, the **Credentials** is created for the new merchant.

Custom object located at
Merchant Tools > Custom Objects > MultiMerchantBySite

Manage 'MobileFirst' (MultiMerchantBySite)

Fields with a red asterisk (*) are mandatory. You can view and edit the name and description in other languages, if required. Click **Apply** to save the details.

Config	
 SiteID: *	<input type="text" value="MobileFirst"/>
Merchant ID:	<input type="text" value="SAPIENTNITROECOM"/>
XML User Name:	<input type="text" value="XU5UIXKPP30S30WTY3FP"/>
XML Password:	<input type="password" value="....."/>
Confirm XML Password:	<input type="password" value="....."/>

Checklist for troubleshooting

1. Service Configuration for the new MID using.
2. Custom Preferences should have Merchant ID
3. If MultiMerchant is enabled
Check the CustomObjects and it should have credentials
4. For Notifications, make sure the checkboxes for events and URL is updated in MAI.

5. PRODUCTION SETUP

5.1 PRODUCTION SERVICE SETUP

Steps for setting up the production service in business manager

1. In business manager navigate to “Administration > Operations > Services”
2. Click on “Credentials” Tab
3. Create new credentials by providing the merchant code, production URL, username and password
4. Now, navigate to “Merchant Tools > Site Preferences > Custom Preferences”
5. Inside “Worldpay” group “Merchant Code for Worldpay” as created in step 3. Also modify the other desired preferences on need basis
 - a) Worldpay Client Side Encryption Public Key
 - b) Worldpay MAC Secret Code
 - c) Worldpay Merchant Number
 - d) Worldpay Installation Id
6. In case if for separate merchant to be used at APM level, then service detail modification to be done in “Merchant Tools > Ordering > Payment Methods”

6. OPERATIONS, MAINTENANCE

6.1 DATA STORAGE

6.1.1 Order Level Attributes

Some additional attributes are defined and stored in Order object. These are the custom attributes and will be sent as a part of Order XML, so that Order Management System can use the same for further processing.

Sr. No.	Additional Custom Fields	Attribute Id	Description
1	Refusal/Decline Code	declineCode	This field capture the value of declined code from Worldpay response.
2	Risk Score	riskScore	This field capture the string sends by for Risk management or Risk Guardian.
3	Authorization ID	authID	This field captures the value of Authorization ID for Authorized Request.

4	Masked Card Number	cardNumer	This field captures the masked card number from Worldpay response.
5	CVC Result Code	cvcResultCode	This field capture CVV status code from response
6	AVS Result Code	avsResultCode	This field capture AVS status code from response

8	AAV Postcode Result Code	aaVPostcodeResultCode	This field will be populate from Authorization response of AMEX card
9	AAV Address Result Code	aaVAddressResultCode	This field will be populate from Authorization response of AMEX card
10	Issuer Response	issuerResponse	Response from Issuer After 3D verification
11	AAV Email Result Code	aaVEmailResultCode	Email Result Code
12	AAV Telephone Result Code	aaVTelephoneResultCode	Telephone Result Code
13	SEPA Mandate ID	mandateID	Mandate ID created for SEPA transaction
14	Worldpay Last Event	WorldpayLastEvent	Last Event occurred on order at Worldpay

15	Worldpay MAC Missing	worldpayMACMissingVal	True when Mac error received in redirect Credit Card or APM response URL
16	AAV Cardholder Name Result Code	aaVCardholderNameResultCode	Card Holder Name Result Code

6.1.2 Order Payment Instrument Attributes

Apart from capturing the Order Attributes, we also capture some Order Payment Instrument attributes. These are specific to the Payment Method and are captured in <payment> tag.

Sr. No.	Additional Custom Fields	Attribute Id
1	Bank	bank
2	Installments	installments Note: Please contact Worldpay for further information on the max number of installments.
3	CPF	cpf
4	BankCode	bankCode
5	Worldpay Merchant ID	Merchant Hex Code whose order is placed
6	Worldpay Token Requested	Token requested value where selected for cards

6.1.3 Order Notification Custom Object

The attributes for custom Object '**OrderNotifyUpdates**' are defined in the below table. A new custom Object is created each time a notification is received with all these attributes and the custom object will be retained until the time it is deleted by the Notification job.

Sr. No.	Additional Custom Fields	Attribute Id
1	Order No	orderNo
2	Xml String	xmlString
3	Custom Object ID	ID

4	Time Stamp	timeStamp
---	------------	-----------

6.2 AVAILABILITY

<EXPECTED AVAILABILITY / UPTIME OF ANY EXTERNAL SERVICE, INTERFACES>

<FALLBACK SOLUTION, BEHAVIOR IF EXTERNAL SERVICES ARE NOT AVAILABLE, IMPACT ON CUSTOMER STOREFRONT>

<ANY EXISTING UTILITIES THAT HELP TO DETECT AVAILABILITY/ UPTIME OF EXTERNAL SERVICE, E.G. WEBSERVICE CALL, GOMEZ PING>

<ESTIMATED PERFORMANCE METRICS FOR PEAK BUSINESS HOURS IF AVAILABLE>

<NOTIFICATION PROCESS IF EXTERNAL SERVICES, INTERFACES ARE NOT RESPONDING, E.G. HOTLINE / SUPPORT PHONE NUMBER>

6.3 SUPPORT

Worldpay to add content here

Name	Email	Support Type
Lochan Sim	Lochan.Sim@worldpay.com	Primary
Rhuta Patel	Rhuta.Patel@worldpay.com	Secondary
Jonathan Berry	jonathan.berry@worldpay.com	Secondary

7. USER GUIDE

7.1 ROLES, RESPONSIBILITIES

Typically, the backend developer does most of the integration works. We expect that the person doing this integration is familiar with the web service, xml processing and has hands on experience with the SFCC platform

7.2 BUSINESS MANAGER

NA [As changes required for storefront has been already covered under setup section]

7.3 STOREFRONT FUNCTIONALITY

NA [As changes required for storefront has been already covered under setup section]

1. KNOWN ISSUES

- Worldpay Notify URL and Worldpay notifyupdate URL are exposed as public; there is no security check available like MAC security check. As there is, no such data sent from Worldpay to validate. To provide some level of security we have applied IP level validated to the URL. Merchants must ensure that they have applied proper security on these URL's.

APPENDIX A: APM/Card mapping keys

Supported Cards Mapping table:

Card Name	Key Value	Test card number
Airplus	AIRPLUS-SSL	122000000000003
American Express	AMEX-SSL	34343434343434
Dankort	DANKORT-SSL	5019717010103742
Diners	DINERS-SSL	36700102000000
Discover card	DISCOVER-SSL	6011000400000000
JCB	JCB-SSL	3528000700000000
Laser	LASER-SSL	630495060000000000 630490017740292441
Maestro	MAESTRO-SSL	6759649826438453, 6799990100000000019
MasterCard	ECMC-SSL	5555555555554444, 5454545454545454
Visa	VISA-SSL	4444333322221111, 49118300000000

Supported Payment Method Mapping table:

Payment Method Name	Key Value
Konbini	KONBINI-SSL
Poli	POLI-SSL
Poli NZ	POLINZ-SSL
Przelewy24	PRZELEWY-SSL
SEPA-DD	ELV-SSL
Alipay	ALIPAY-SSL
Boleto	BOLETO-SSL
CashU	CASHU-SSL
Credit Card – Direct	CREDIT_CARD
Credit Card – Redirect	Worldpay
China Union Pay	CHINAUNIONPAY-SSL
ENETS	ENETS-SSL
Giropay	GIROPAY-SSL
IDEAL	IDEAL-SSL
Mistercash	MISTERCASH-SSL
Paypal	PAYPAL-EXPRESS
Sofort	SOFORT-SSL
Qiwi	QIWI-SSL
Yandex	YANDEXMONEY-SSL

APPENDIX B: IDEAL Bank List

Bank Name	Bank Code
ABN	ABN_AMRO
ASN	ASN
ING	ING
Knab	KNAB
Rabobank	RABOBANK
SNS	SNS
SNS Regio	SNS_REGIO
Triodos	TRIODOS
Van Lanschot	VAN_LANSCHOT

APPENDIX C: Error Codes and Error Messages for Transaction Notification

Master Error Code	Error Message
111	XML Parse error has occurred
112	XML Corrupted, Could not find Order No.
113	XML in Custom Object Corrupted
114	Error occurred while deleting Custom Object
115	Error occurred while reading status history from Order Object
116	Error occurred while Updating Order Object
117	Error occurred while reading Custom Object
118	No Transaction History Available
119	Last status Not available as No Transaction History is Available
120	Wrong Order Number

APPENDIX D: Order Notification and SFCC Order status mapping

Order Notifications Received From Worldpay	Changes in Order object in Business Manager
AUTHORISED	Order Status: NEW Payment Status: no change Export Status: READY FOR EXPORT Confirmation Status : CONFIRMED
CANCELLED	Order Status: FAILED/CANCELLED Payment Status: NOT PAID Export Status: NOT EXPORTED Confirmation Status : NOT CONFIRMED
CAPTURED	Order Status: COMPLETED Payment Status: PAID Export Status: no change Confirmation Status : no change
SENT_FOR_REFUND	Order Status: no change Payment Status: no change Export Status: no change Confirmation Status : no change
REFUSED	Order Status: FAILED Payment Status: NOT PAID Export Status: NOT EXPORTED Confirmation Status : NOT CONFIRMED
SETTLED	Order Status: no change Payment Status: no change Export Status: no change Confirmation Status : no change
INFORMATION_REQUESTED	Order Status: no change Payment Status: no change Export Status: no change Confirmation Status : no change
CHARGED_BACK	Order Status: no change Payment Status: no change Export Status: no change Confirmation Status : no change
EXPIRED	Order Status: FAILED Payment Status: NOT PAID Export Status: NOT EXPORTED Confirmation Status : NOT CONFIRMED

APPENDIX E: Error Codes and Error Messages

Master Error Code	Error Message
worldpay.error.code1	Internal error has occurred, please choose a different Payment Method or try again later.
worldpay.error.code2	Parse error has occurred, please choose a different Payment Method or try again later.
worldpay.error.code3	Invalid amount error, please choose a different Payment Method or try again later.
worldpay.error.code4	Security error, please choose a different Payment Method or try Again later.
worldpay.error.code5	Invalid request, please choose a different Payment Method or try again later.
worldpay.error.code6	Please choose a different Payment Method or try again later.
worldpay.error.code7	Payment details in the order element are incorrect, please choose a different Payment Method or try again later.
worldpay.error.code8	Submission error , please choose a different Payment Method or Try again later.
worldpay.error.generalerror	Please choose a different Payment Method or try again later.
worldpay.error.cancelerror	Your transaction has been cancelled.

APPENDIX F: Enabling and disabling worldpay integration

1. Go to Merchant tools > Ordering > Payment Methods
2. Disable all the worldpay specific payment methods
3. Also cross check one by one for the type of processor, the payment method is using (To check it, click on any of the payment method let us say, CREDIT_CARD, and see the Payment Processor). If it is worldpay, change it to some other-desired processor (e.g. For CREDIT_CARD, BASIC_CREDIT).
4. Enable the payment methods we want to use with the type of processor.
5. To enable it again change the processor type to worldpay.
6. Go to Merchant Tools> Site Preferences > custom Preferences > worldpay and disable 'Enable Apm look up service'.

APPENDIX G: FAILURE & ERROR

Whenever we are receiving any error or failure that may be because of the service failure, or service down, or because of the request response errors, we are alerting errors in the front end with proper errors that will stop the transaction flow.

Scenario examples:

Service Response = null {Service does not exist}

Service Response = error {Service exists but the response contains error}

Service Response = error code {Service exists but the response contains

error} **what we are showing on frontend:**

worldpay.error.code0 = this payment service is temporarily unavailable, please choose a different Payment Method or contact shop administrator.

Whenever we are receiving errorcode0 from worldpay, we are mapping it with this message and showing in the front end. All the errors are configured in the properties file (worldpayerror.properties)
